OneSound Design

- This just is to provide the general direction we want. There are more screens shown here than we want designed from 99designs to show how the app completely works. Please feel free to explore any changes

- Specifically, we want the “main party,” Profile, and Home screens designed

  - **“Main party”**: the combined version of the “Now Playing” and “Playlist” as shown on page 5 (the yellow box)

  - **Profile**: something more visually attractive and engaging than what we currently have. Perhaps including info for these features we plan on adding: Favorite songs, user Followers, Following users

  - **Home**: presently, when the app opens it will jump you into your current Party. If you don’t have one, it only shows the Profile, which is fairly bland. We would like some kind of “Home” view that we can always have as a main tab. This would be where users search for parties, we show them nearby parties (based on GPS), etc. If there are not nearby parties, then maybe have it show something interesting like a collage of current popular songs, users, etc.

Prototype Logos

- These are not finalized, but simply shown here to give an idea of what our logo/app icon will look like so it can be factored into any design decisions

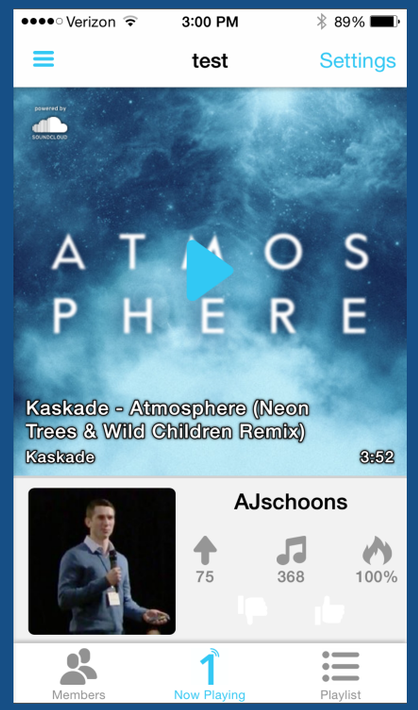
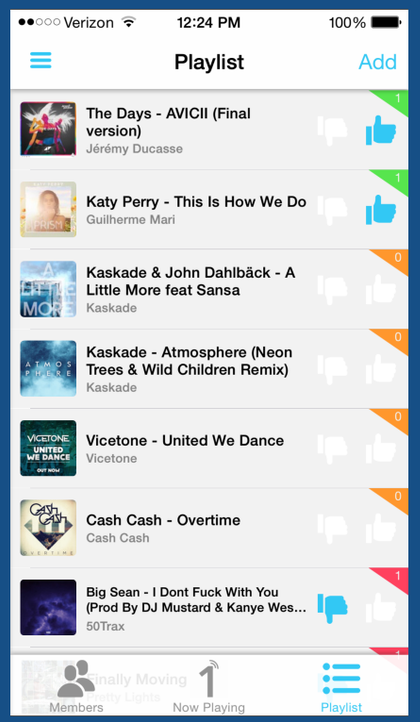
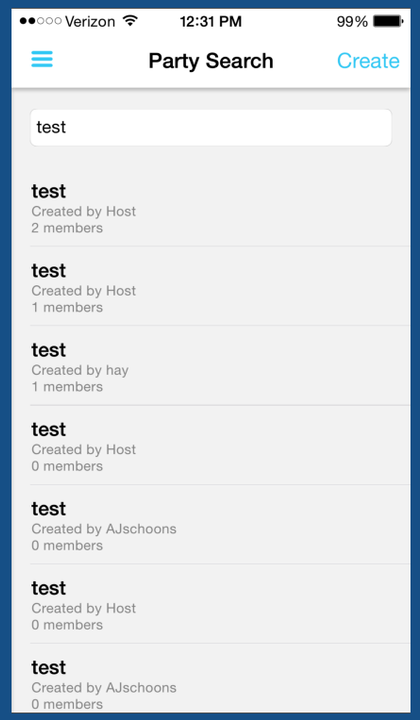
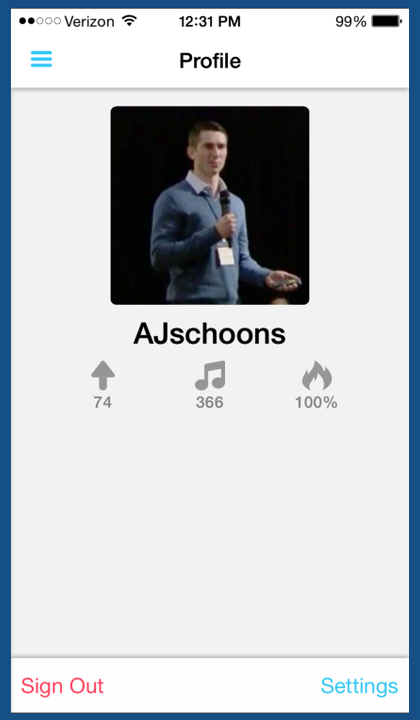
Main party page



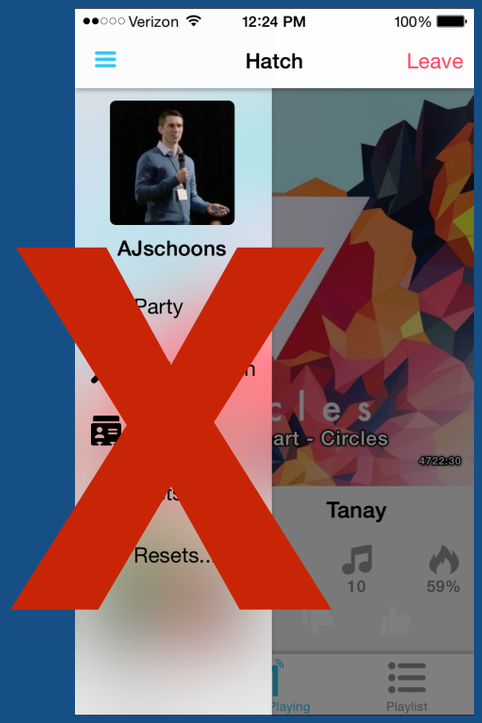
Playlist

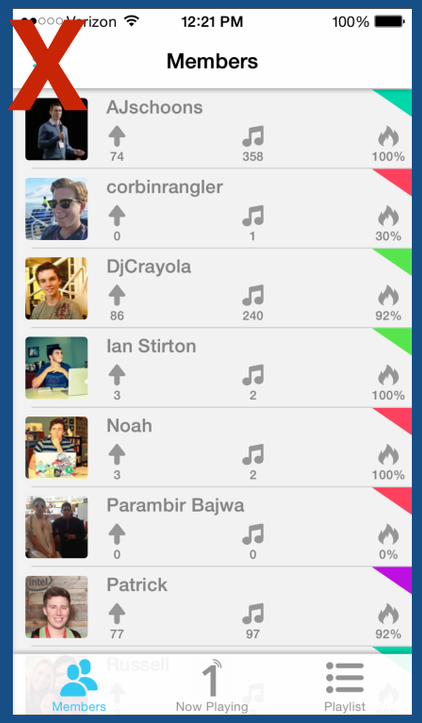


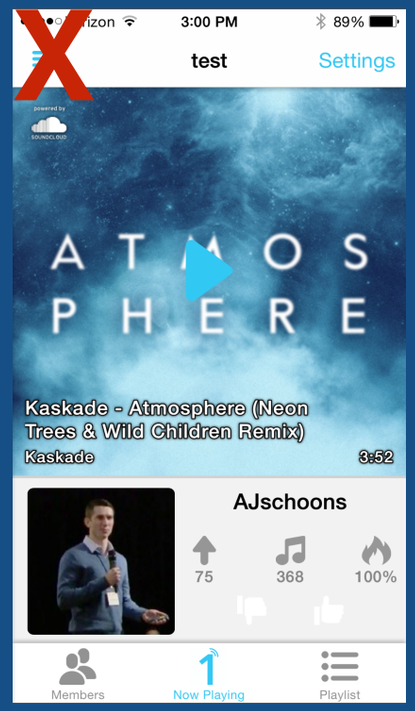


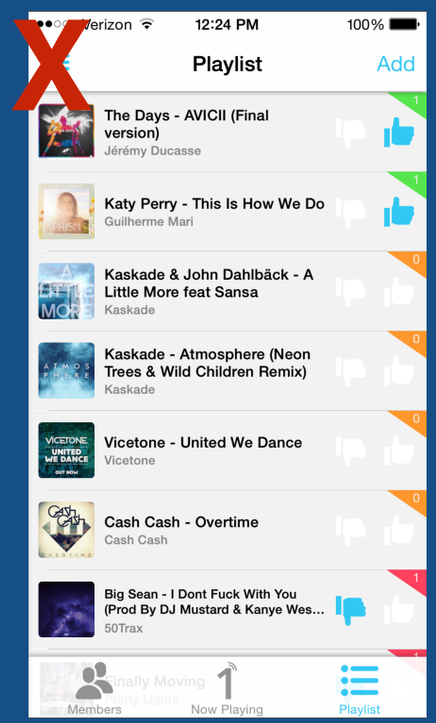


Desired Changes

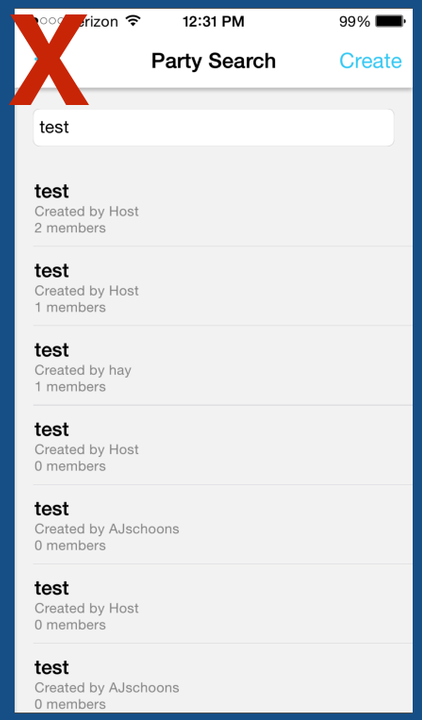


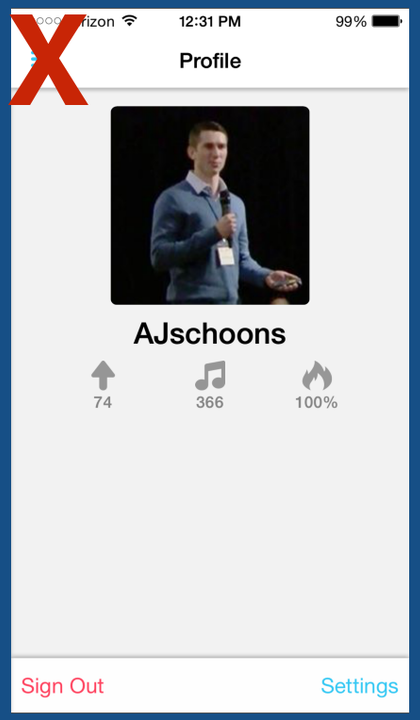




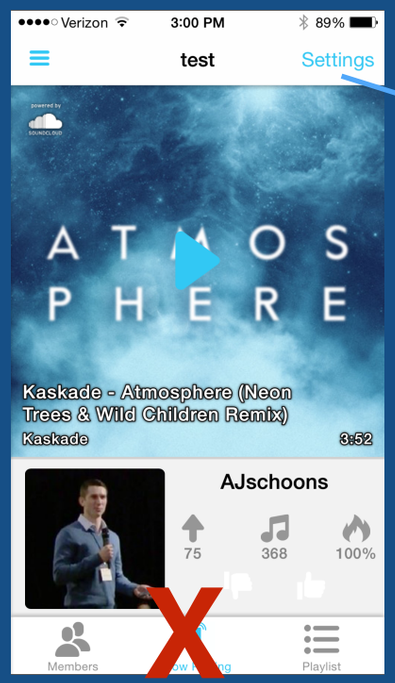


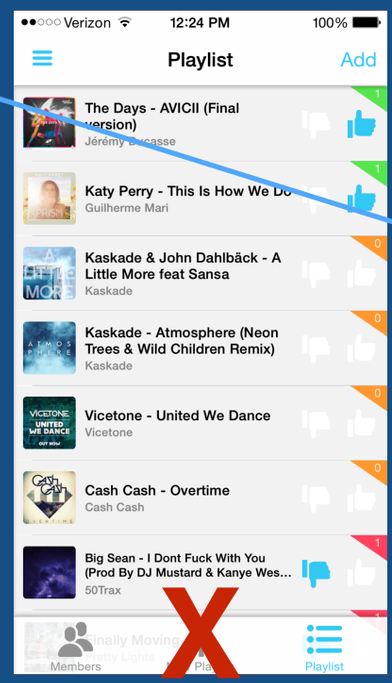
Remove the side menu, instead using a tab bar for navigating between different ideas. See the example apps at the end

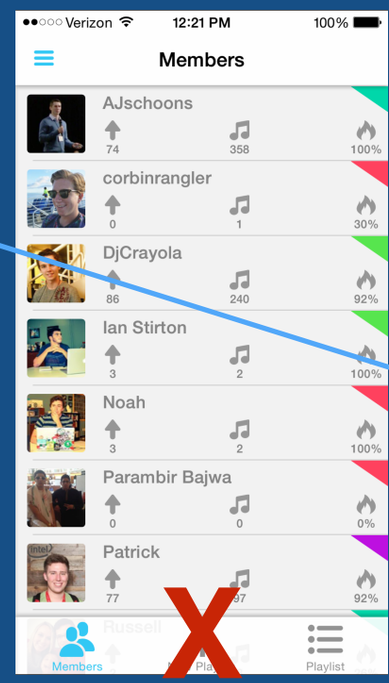


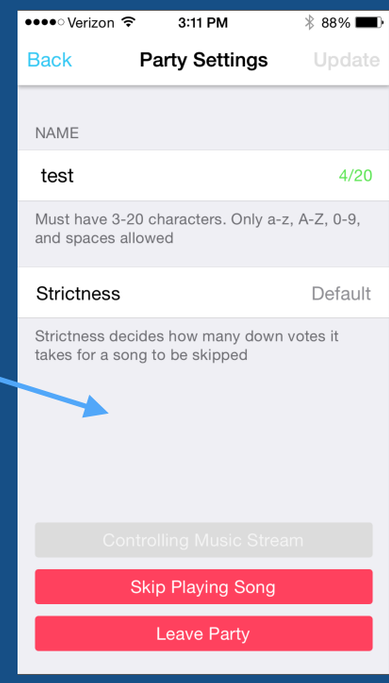


Desired Changes









All the party pages should be condensed into 3 swipe-able pages, like Twitter. Have the nav bar include a button to add a song

Right now, the settings button opens a modal view for the party settings. Instead, make this a constant viewable page. Note that actually changing the settings is only for the party host

Combine these into one view, with the "Now Playing" song larger than the other songs in the playlist; potentially having it expand/contract as the playlist scrolls down

Remove the tab bar at the bottom of the party page since the app will instead have a static tab bar instead of the side menu. Instead, use a Twitter-like swiping/paging design to get between the party pages
